

# Econometrics A

## Handout 1: Summary

Laura Mayoral

IAE and BGSE

INSEAD, January 2021

# Summary Session 1

- Overview of the course
  - Goal: estimate the causal impact on a variable (s) on another variable.

# Summary Session 1

- Overview of the course
  - Goal: estimate the causal impact on a variable (s) on another variable.
  - Important: do not confuse correlation (or, in general, statistical association) and causality

# Summary Session 1

- Overview of the course
  - Goal: estimate the causal impact on a variable (s) on another variable.
  - Important: do not confuse correlation (or, in general, statistical association) and causality
  - Two main type of studies:
    - \* **Observational studies**: individuals self-select themselves to the treatment

# Summary Session 1

- Overview of the course
  - Goal: estimate the causal impact on a variable (s) on another variable.
  - Important: do not confuse correlation (or, in general, statistical association) and causality
  - Two main type of studies:
    - \* **Observational studies**: individuals self-select themselves to the treatment
    - Selection bias**: the treatment is correlated with the characteristics of the individuals

# Summary Session 1

- Overview of the course
  - Goal: estimate the causal impact on a variable (s) on another variable.
  - Important: do not confuse correlation (or, in general, statistical association) and causality
  - Two main type of studies:
    - \* **Observational studies**: individuals self-select themselves to the treatment
      - Selection bias**: the treatment is correlated with the characteristics of the individuals
    - \* **Randomised studies**: the treatment is applied randomly.

# Summary Session 1

- Overview of the course
  - Goal: estimate the causal impact on a variable (s) on another variable.
  - Important: do not confuse correlation (or, in general, statistical association) and causality
  - Two main type of studies:
    - \* **Observational studies**: individuals self-select themselves to the treatment
      - Selection bias**: the treatment is correlated with the characteristics of the individuals
    - \* **Randomised studies**: the treatment is applied randomly.
    - \* Randomisation solves the selection bias

– Golden Benchmark: Randomisation

- Golden Benchmark: Randomisation
- But randomisation not always possible

- Golden Benchmark: Randomisation
- But randomisation not always possible
- This course: how to estimate causal relationships using observational data

- Golden Benchmark: Randomisation
- But randomisation not always possible
- This course: how to estimate causal relationships using observational data
- Identification strategy: the set of econometric techniques you'll need to use to be able to estimate a causal relationship with the observational data

- Golden Benchmark: Randomisation
- But randomisation not always possible
- This course: how to estimate causal relationships using observational data
- Identification strategy: the set of econometric techniques you'll need to use to be able to estimate a causal relationship with the observational data
- After your identification strategy has been chosen, you have to go to the data
  - \* Population
  - \* i.d.d. samples
